July 11, 2005

# First Direct Detection of the Neutrino

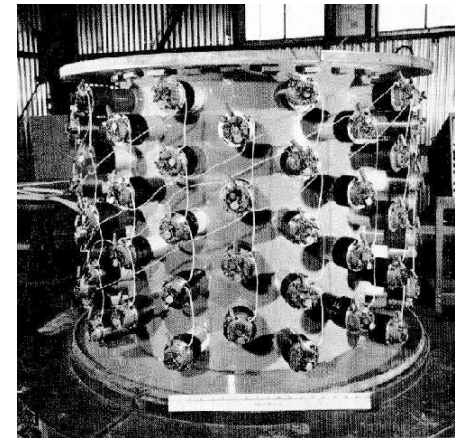

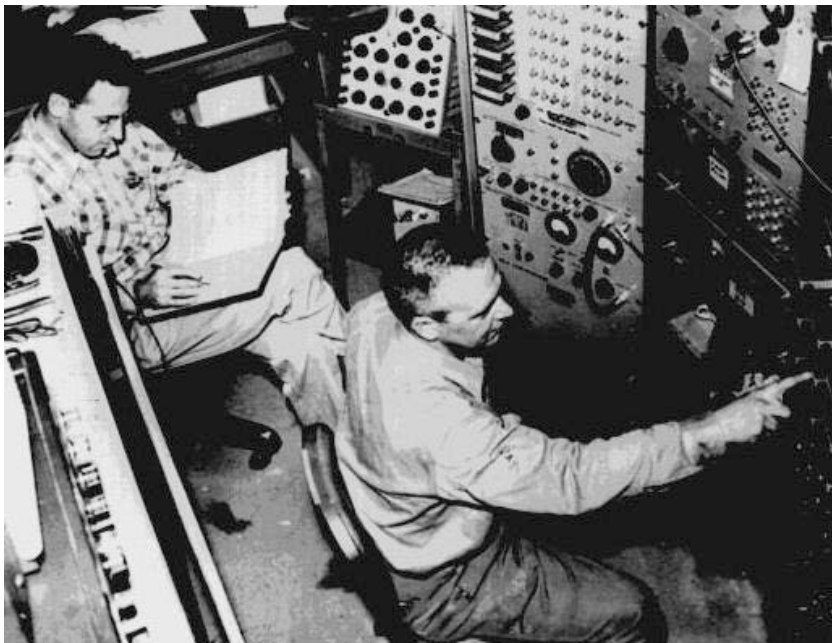

$$\bar{\nu}_e + p \rightarrow e^+ + n$$

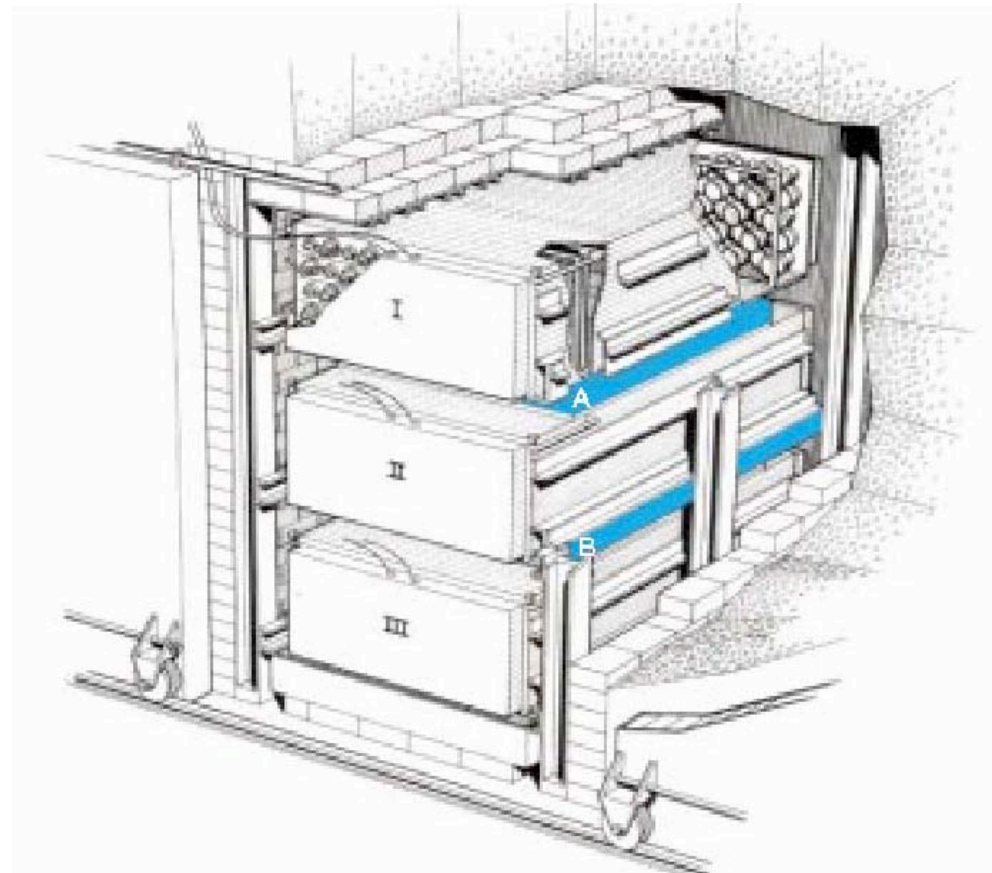

$$\tau \approx 200 \mu\text{s}$$

$$n + p \rightarrow d + \gamma (2.2 \text{ MeV})$$

$$E_{\text{prompt}} \cong E_\nu - \overline{E}_n - 0.8 \text{ MeV}$$

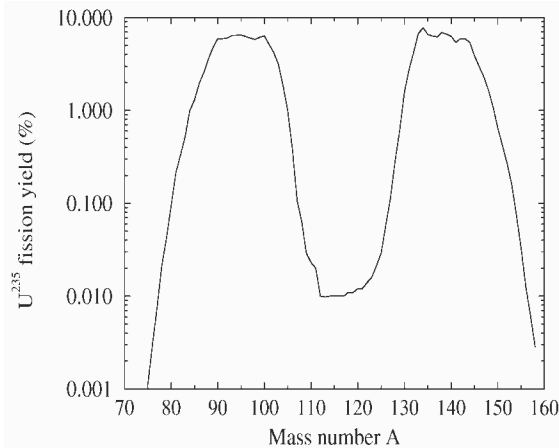

Reines and Cowan 1956

The version of Reines' experiment that worked

# Neutrino Spectra from Principal Reactor Isotopes

$^{235}\text{U}$  fission

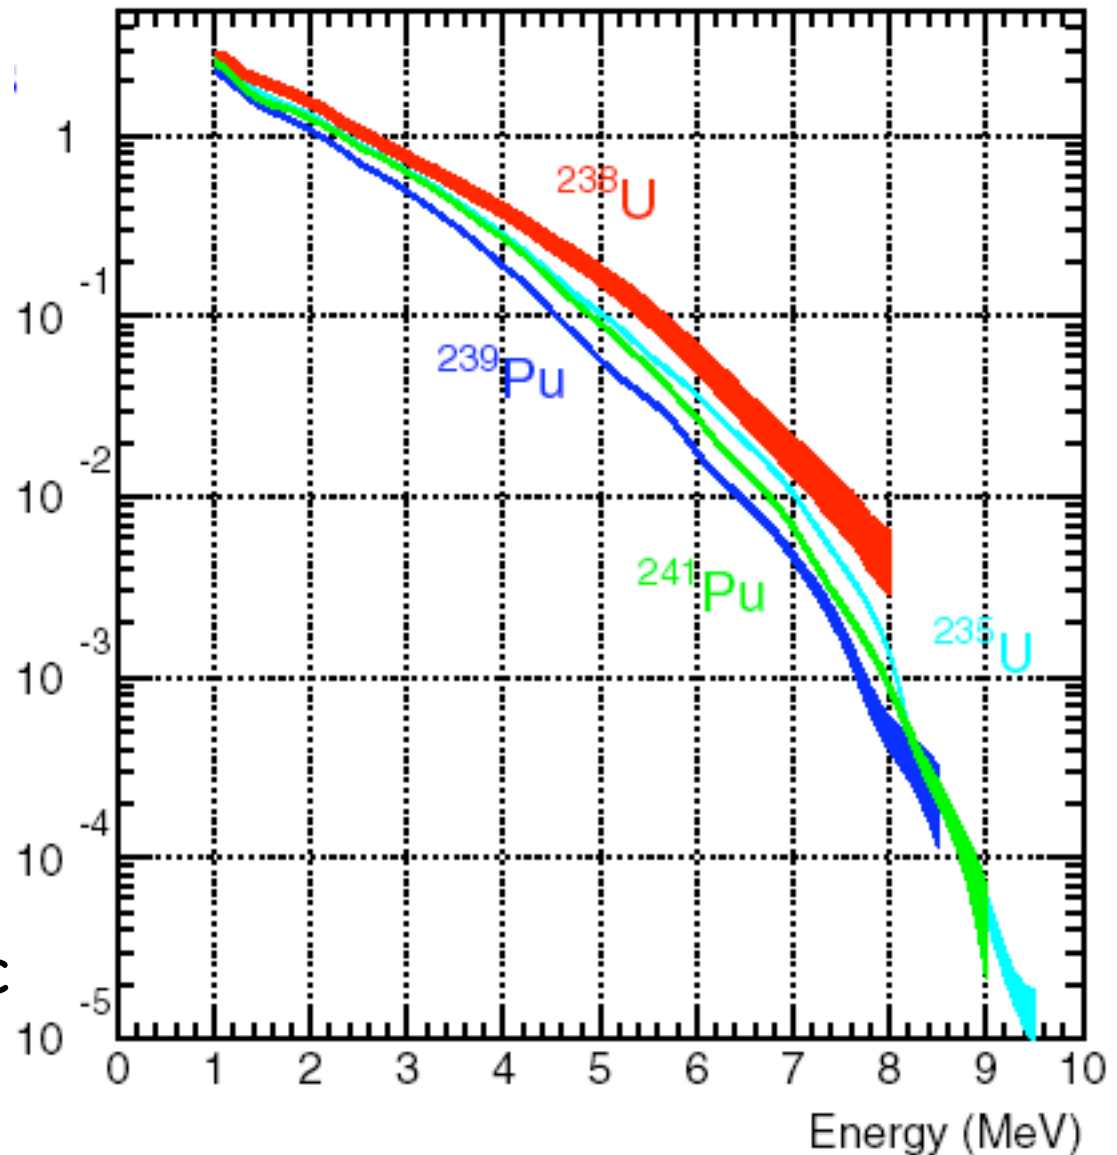

$\sim 200$  MeV per fission

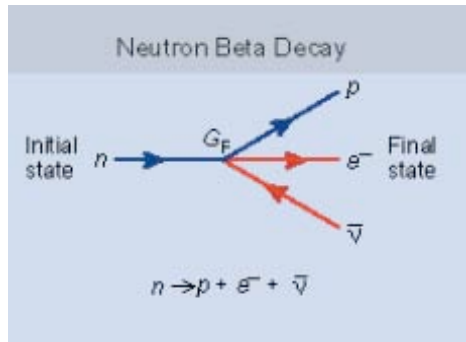

$\sim 6 \bar{\nu}_e$  per fission

$\sim 2 \times 10^{20} \bar{\nu}_e / \text{GW}_{\text{th}}\text{-sec}$

neutrinos/MeV/fission

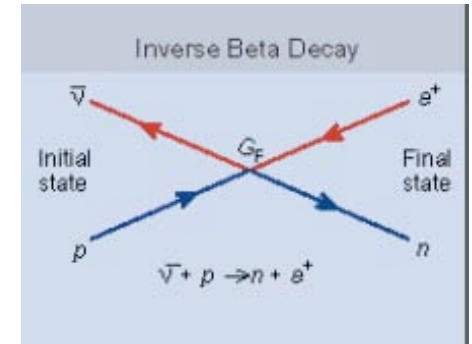

# Inverse Beta Decay Cross Section

$$\sigma_{\text{tot}}^{(0)} = \sigma_0 (f^2 + 3g^2) E_e^{(0)} p_e^{(0)}$$

$$= 0.0952 \left( \frac{E_e^{(0)} p_e^{(0)}}{1 \text{ MeV}^2} \right) \times 10^{-42} \text{ cm}^2$$

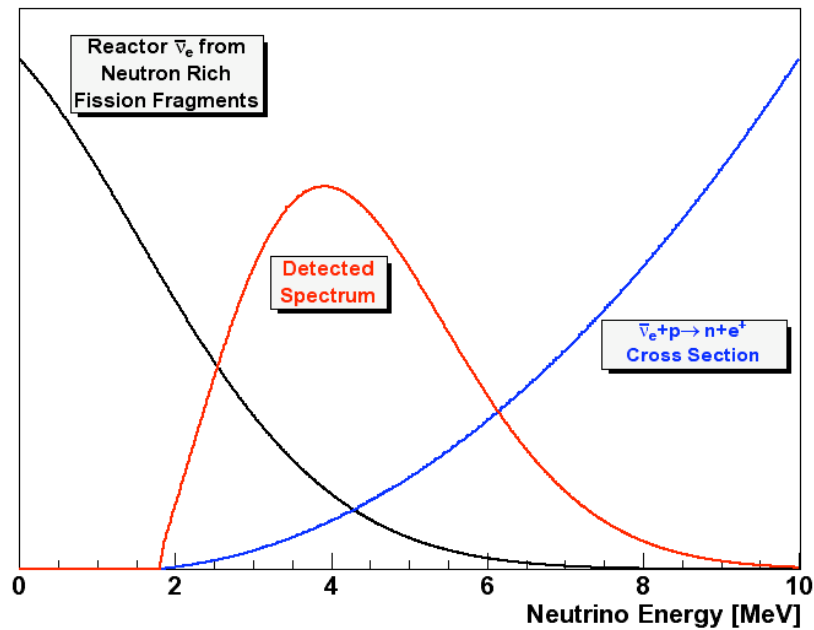

$$\sigma_0 = \frac{G_F^2 \cos^2 \theta_C}{\pi} (1 + \Delta_{\text{inner}}^R)$$

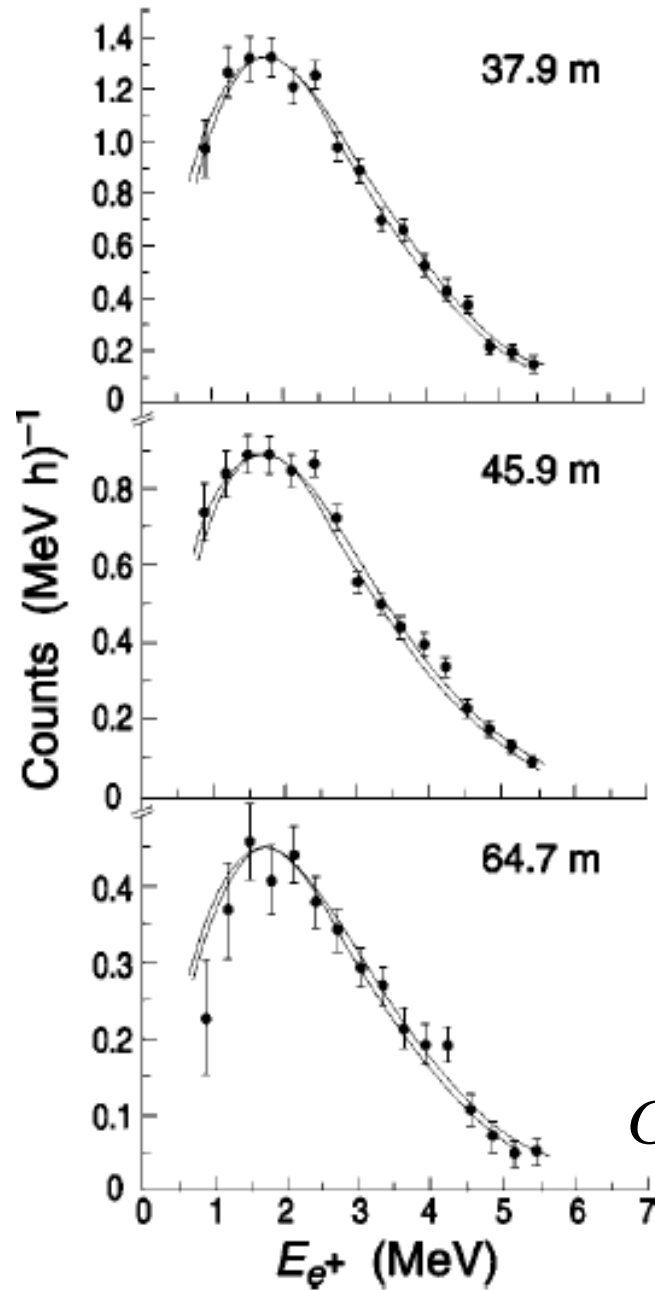

$$\sigma_{\text{tot}}^{(0)} = \frac{2\pi^2/m_e^5}{f_{p.s.}^R \tau_n} E_e^{(0)} p_e^{(0)}$$

# Neutrino Spectrum

# 2004 Data Set

## Is the Neutrino Spectrum Distorted?

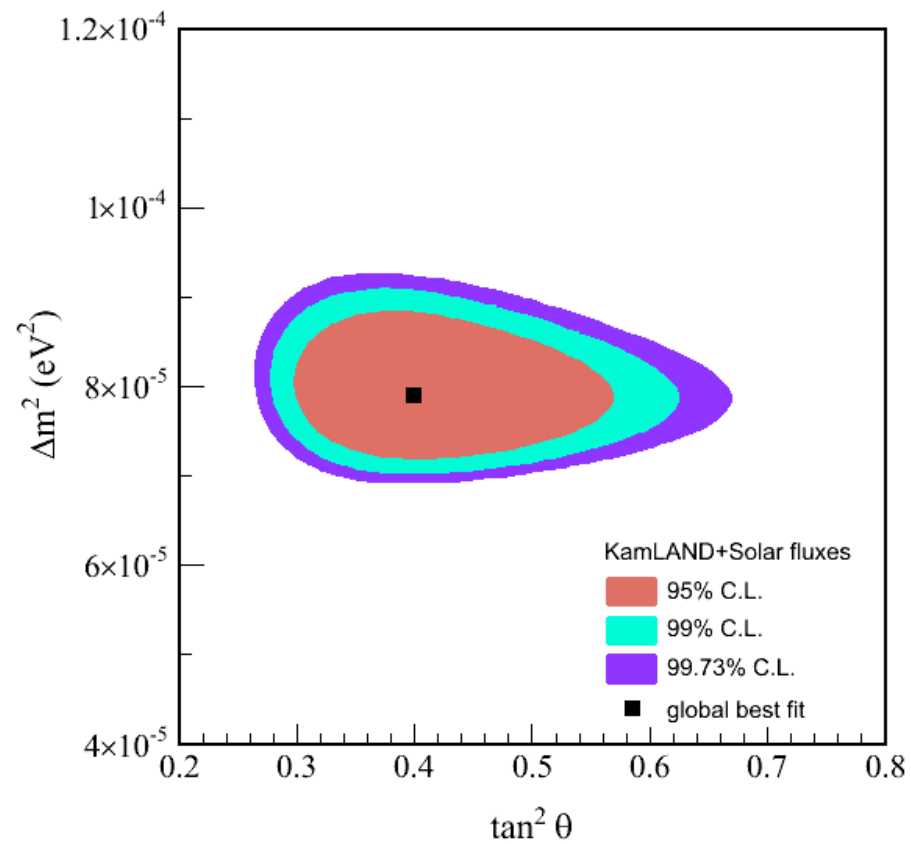

11.1%  $\chi^2_{\text{p}}/\text{DOF} = 24.2/17$ .

0.4% ( $\chi^2_{\text{p}}/\text{DOF} = 37.3/18$ ).

$$\chi^2 / 11 \text{ d.o.f} = 13$$

# Global Fit to KamLAND and Solar Experiments

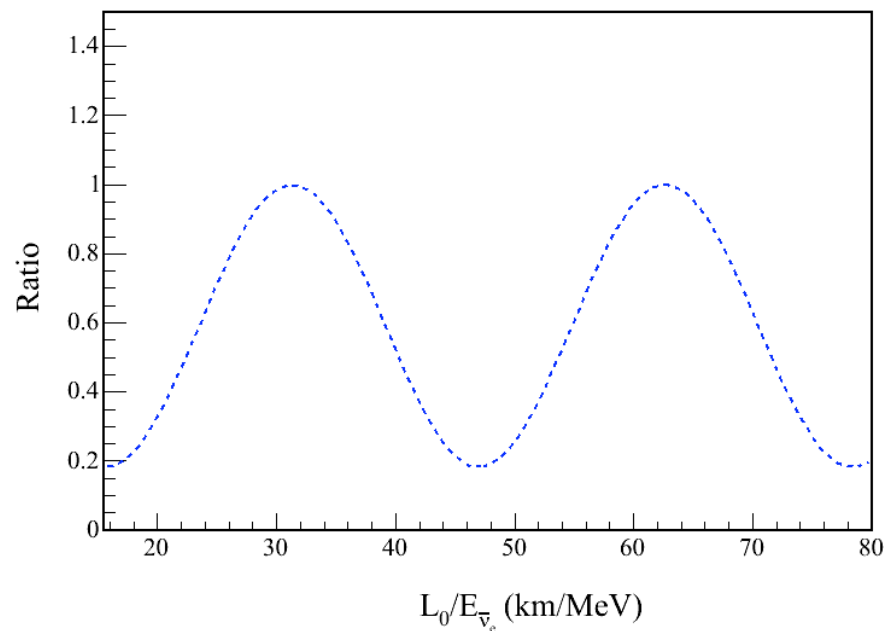

# Looking for the oscillation effect

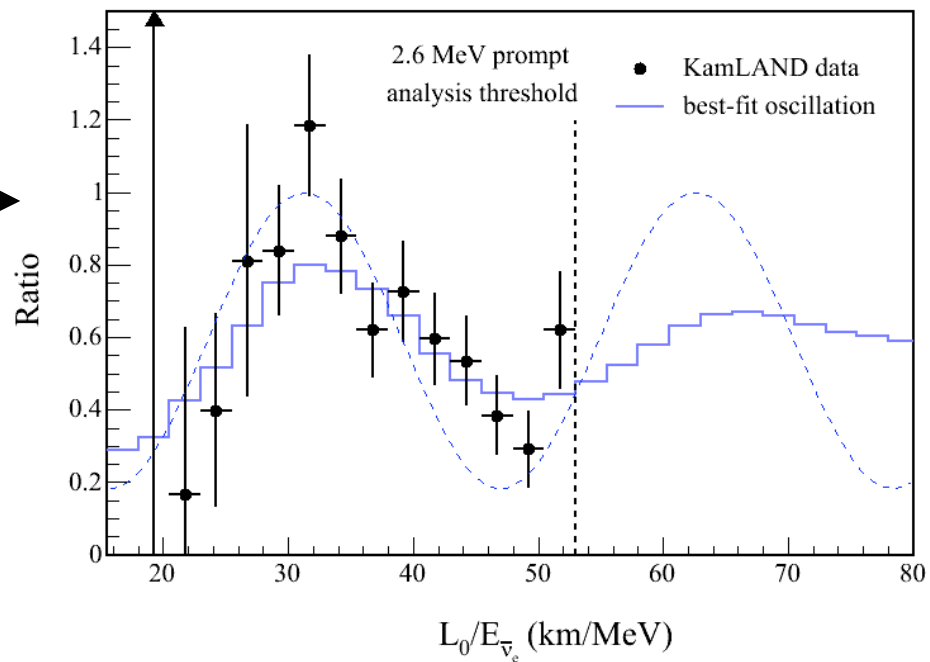

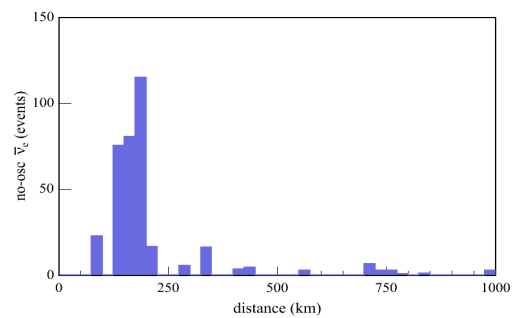

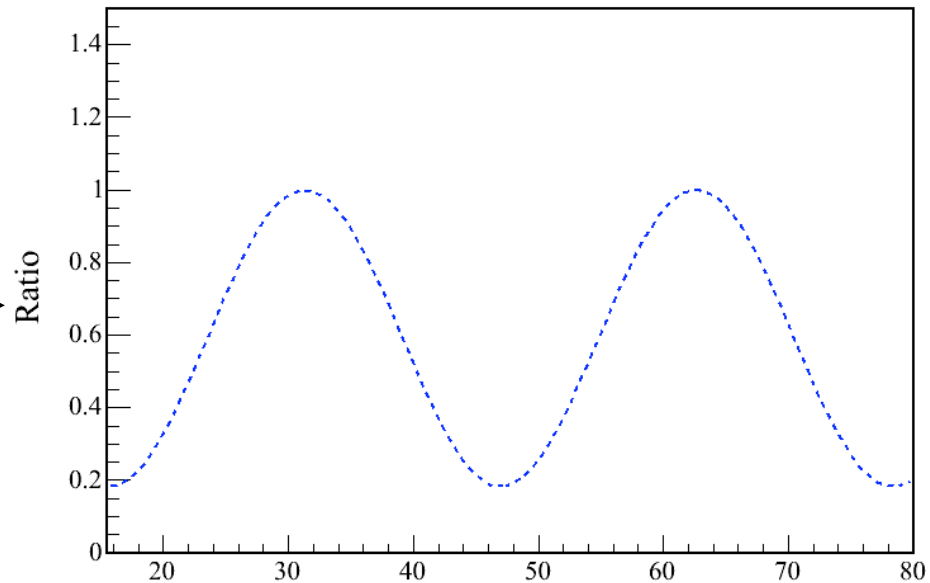

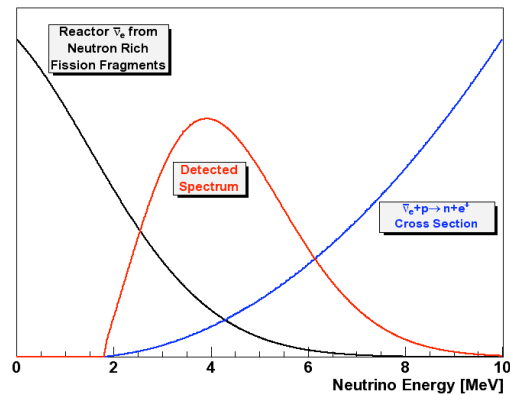

$$\left| \langle \Psi_e(t) | \Psi_e(0) \rangle \right|^2 = 1 - \sin^2(2\theta) \sin^2\left(\frac{(m_2 - m_1)c^2}{2\hbar} t\right)$$

$$P_{ee} = 1 - \sin^2(2\theta) \sin^2\left(1.27 \frac{(m_2^2 - m_1^2)L}{E}\right)$$

$$L = c \cdot t_{lab} \qquad t_{restframe} = \frac{t_{lab}}{\gamma} = \frac{m}{E} t_{lab}$$

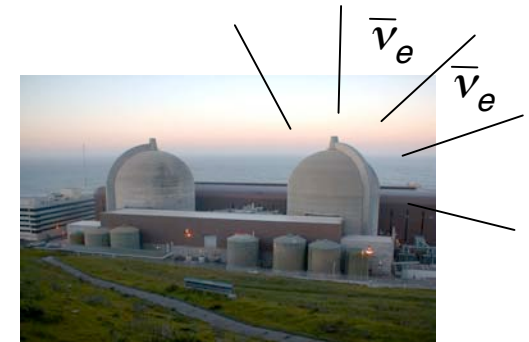

# Observing the oscillations in the neutrino rest frame

• An expeditiously deployed multidetector **reactor experiment** with sensitivity to  $\nu_e$  disappearance down to  $\sin^2 2\theta_{13} = 0.01$ , an order of magnitude below present limits.

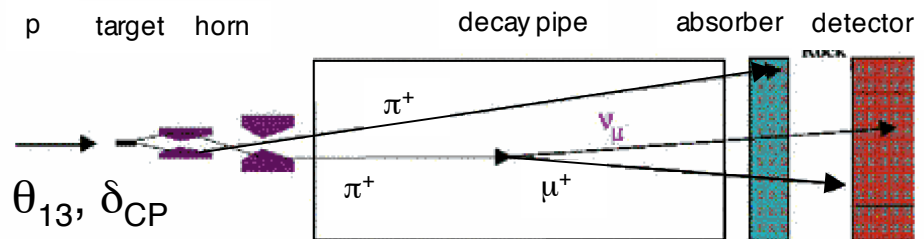

- disappearance experiment  $\bar{\nu}_e \rightarrow \bar{\nu}_e$
- look for rate deviations from  $1/L^2$  and spectral distortions
- observation of oscillation signature with 2 or multiple detectors
- baseline  $O(1 \text{ km})$ , no matter effects

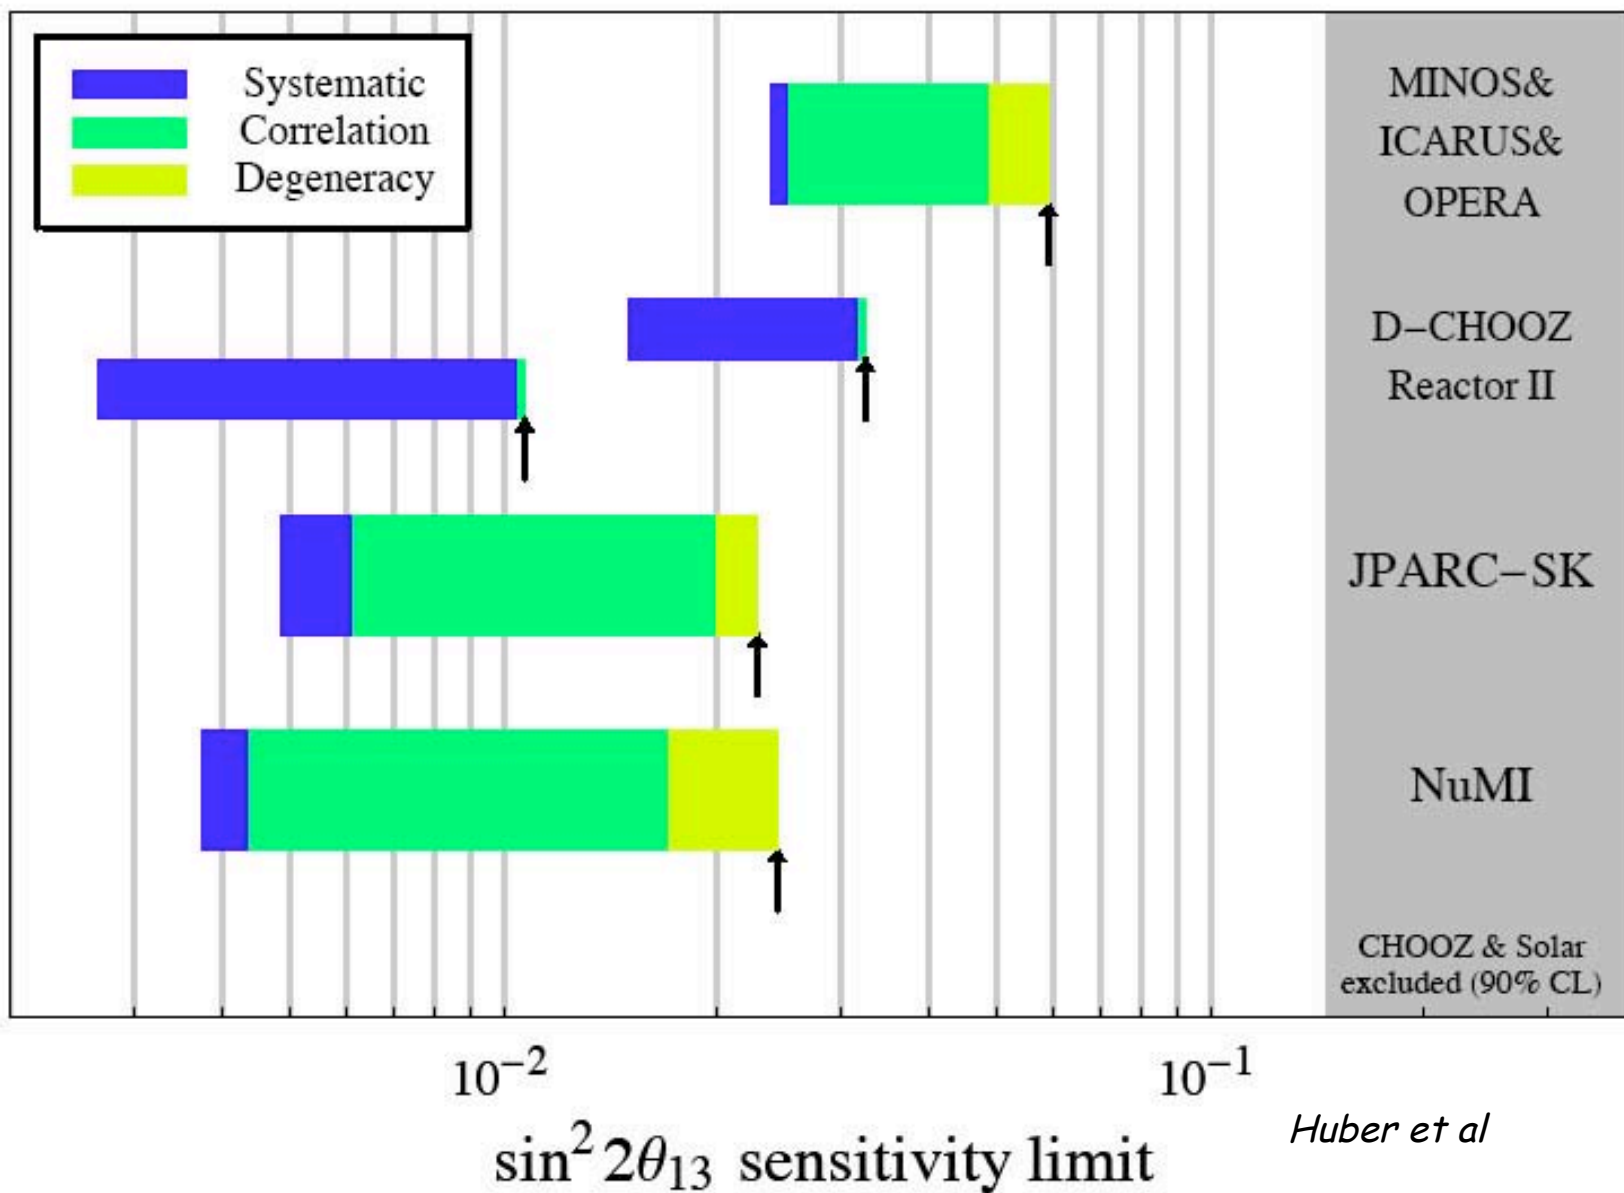

$$P_{ee} \approx 1 - \sin^2 2\theta_{13} \sin^2 \left( \frac{\Delta m_{31}^2 L}{4 E_\nu} \right) - \cos^4 \theta_{13} \sin^2 2\theta_{12} \sin^2 \left( \frac{\Delta m_{21}^2 L}{4 E_\nu} \right)$$

• A timely **accelerator experiment** with comparable  $\sin^2 2\theta_{13}$  sensitivity and sensitivity to the mass hierarchy through matter effects.

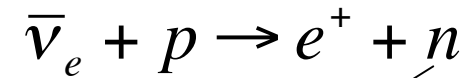

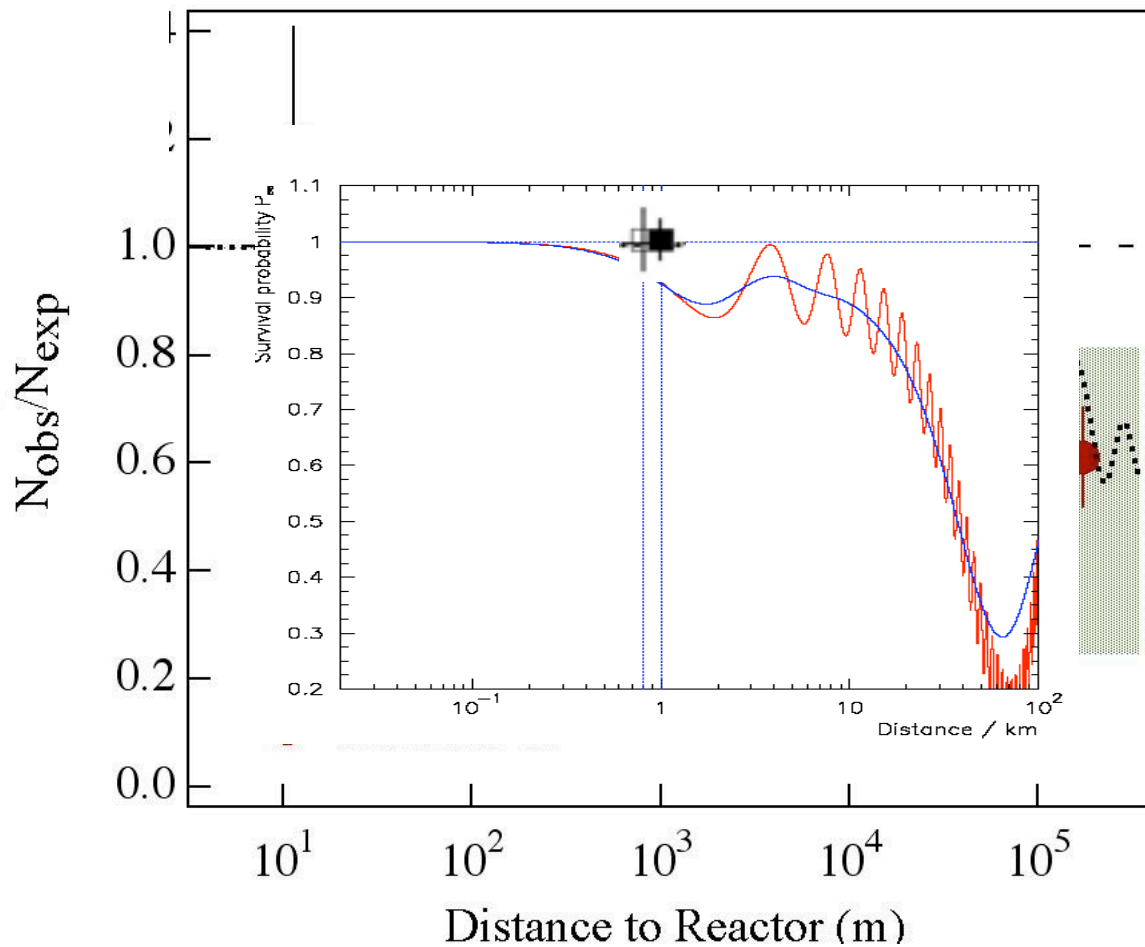

- appearance experiment  $\nu_\mu \rightarrow \nu_e$
- measurement of  $\nu_\mu \rightarrow \nu_e$  and  $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$  yields  $\theta_{13}$ ,  $\delta_{CP}$
- baseline  $O(100 - 1000 \text{ km})$ , matter effects present

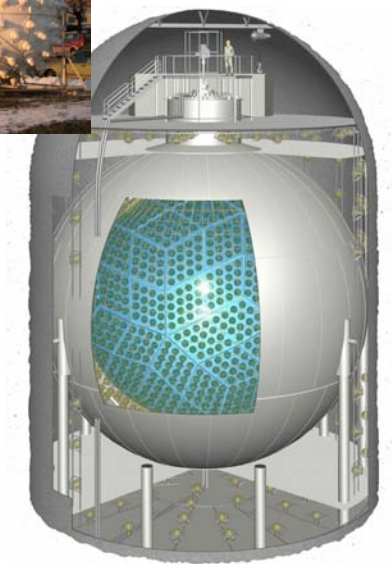

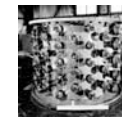

$$P_{\mu e} \approx \sin^2 2\theta_{13} \sin^2 2\theta_{23} \sin^2 \frac{\Delta m_{31}^2 L}{4 E_\nu} + \dots$$

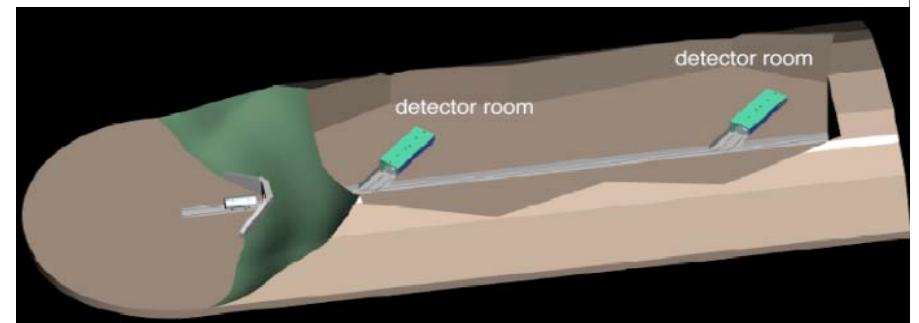

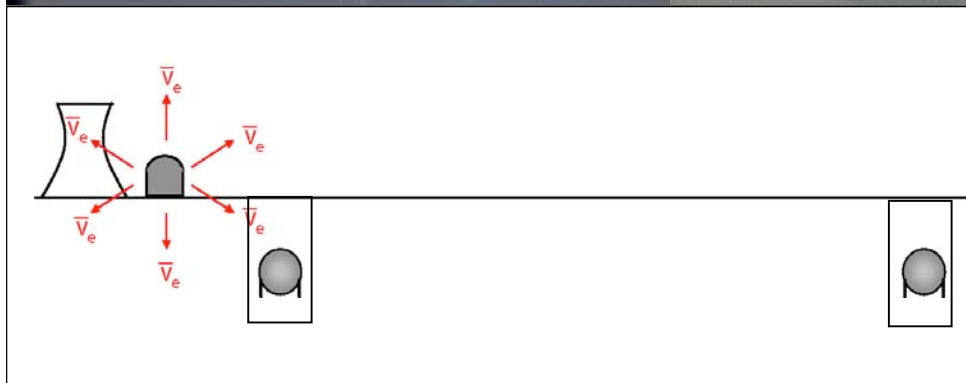

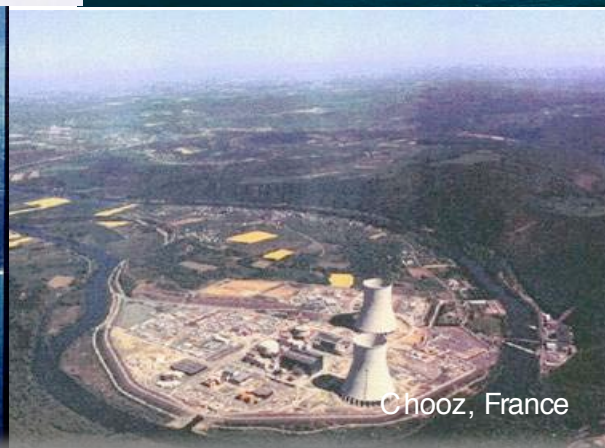

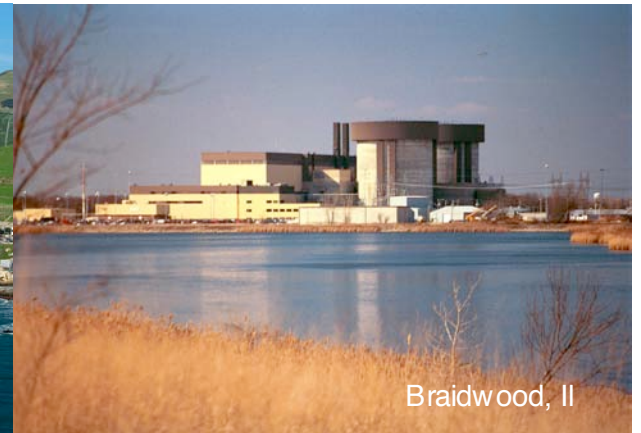

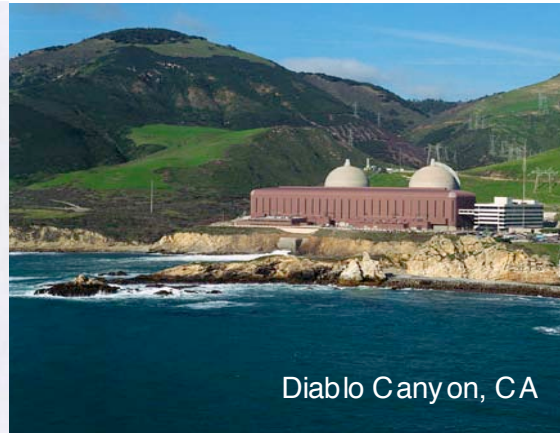

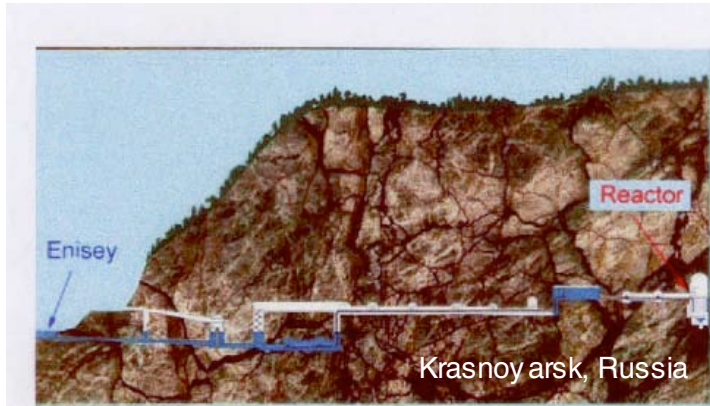

# Reactor Anti-Neutrino Disappearance

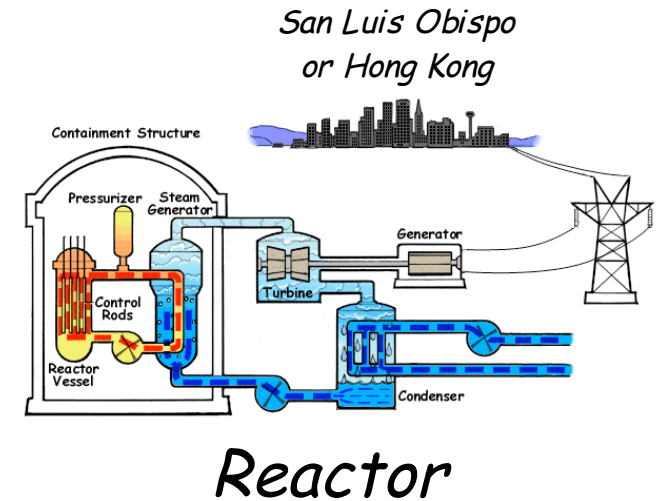

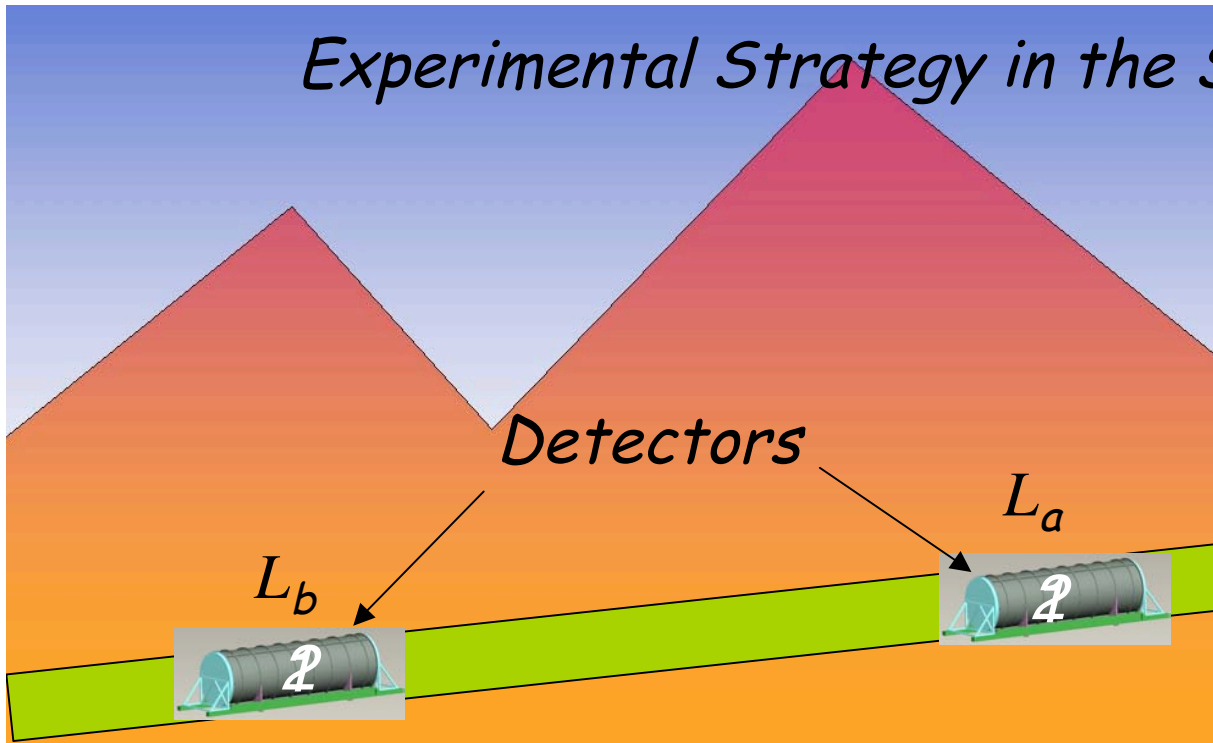

*thermalization  
delay time*

# Many proposed sites for new reactor experiments

# Experimental Strategy in the Simplest Case

$$R_{1aA} = \frac{F_A}{4\pi L_a^2} \varepsilon_1 (1 - \delta_a)$$

$$\frac{R_{1aA}}{R_{2bA}} \frac{R_{2aB}}{R_{1bB}} = \frac{L_b^4}{L_a^4} \frac{(1 - \delta_a)^2}{(1 - \delta_b)^2} \approx \frac{L_b^4}{L_a^4} [1 - 2(\delta_a - \delta_b)]$$

$$(\delta_a - \delta_b) \approx \sin^2(2\theta_{13}) \left[ \sin^2\left(1.27 \frac{\Delta m_{13}^2 L_a}{E}\right) - \sin^2\left(1.27 \frac{\Delta m_{13}^2 L_b}{E}\right) \right]$$

1.00 km.

# Diablo Canyon Nuclear Power Plant

- **Powerful:** Two reactors ( $3.1 + 3.1 \text{ GW } E_{\text{th}}$ )
- **Overburden:** Horizontal tunnel could give 800 mwe shielding
- **Infrastructure:** Construction roads. Controlled access. Close to wineries.

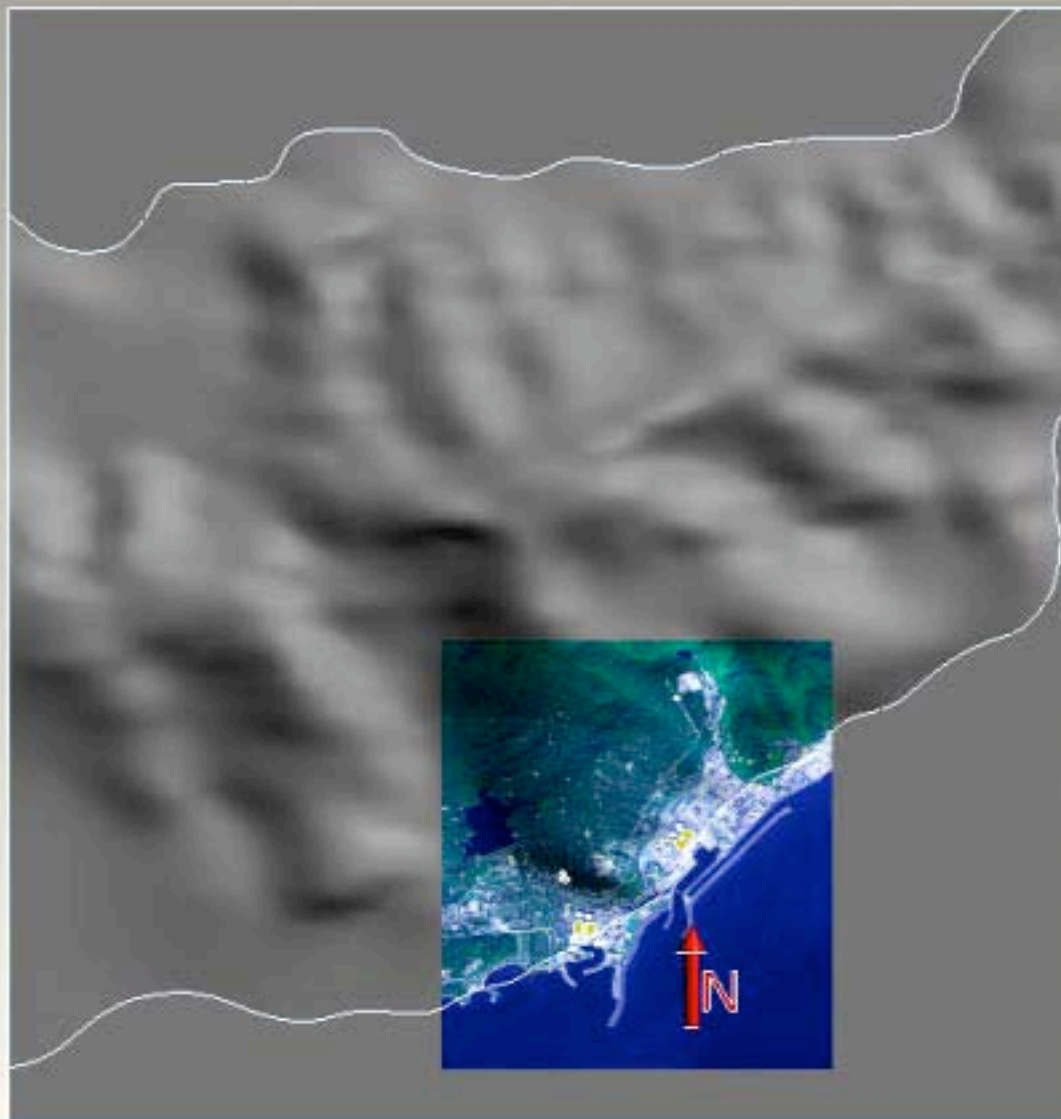

# Daya Bay/Ling Ao Nuclear Power Plant

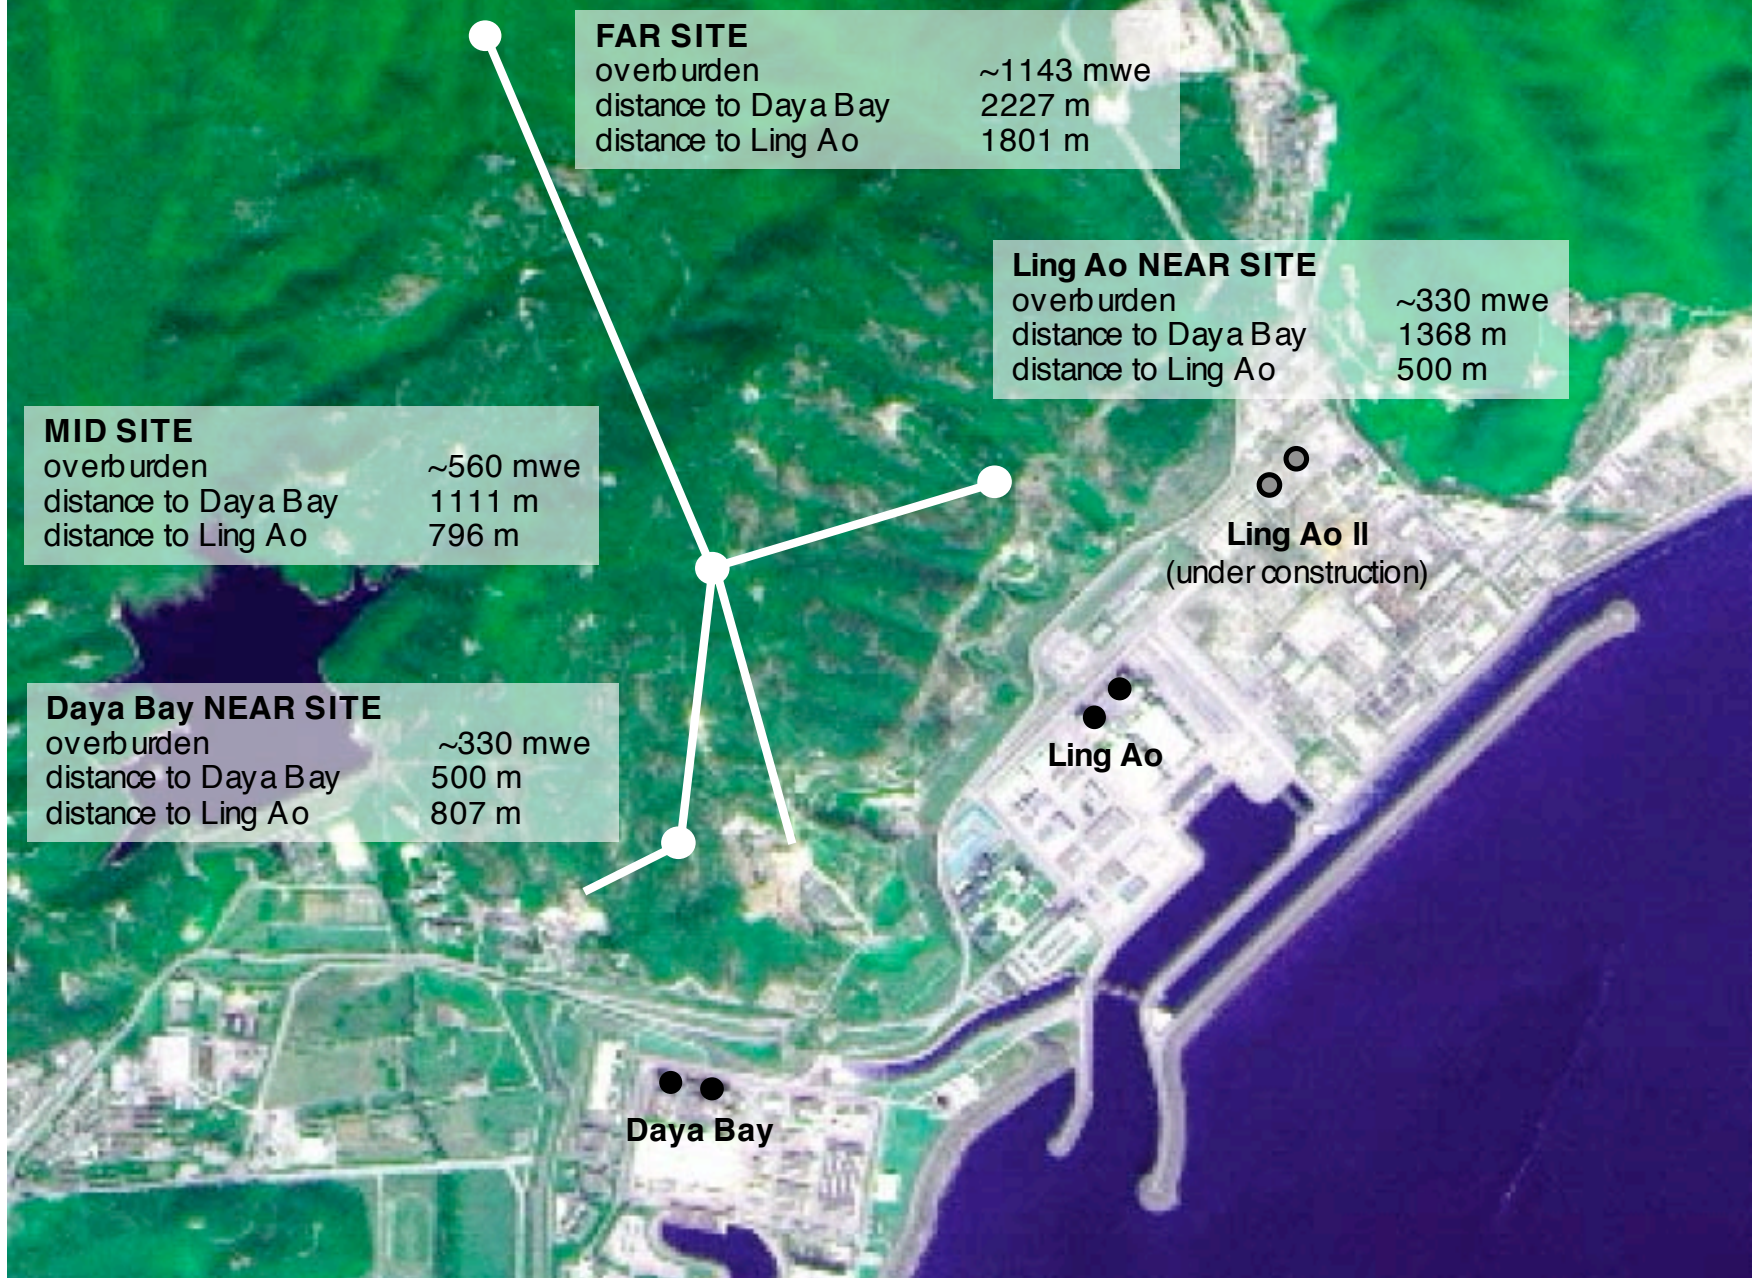

- **Powerful:** Four reactors (4 units  $11.6 \text{ GW } E_{th}$  Eventually 6 units  $17.4 \text{ GW } E_{th}$  )
- **Overburden:** Horizontal tunnel could give 1100 mwe shielding
- **Infrastructure:** Construction roads. Controlled access. Not close to wineries.

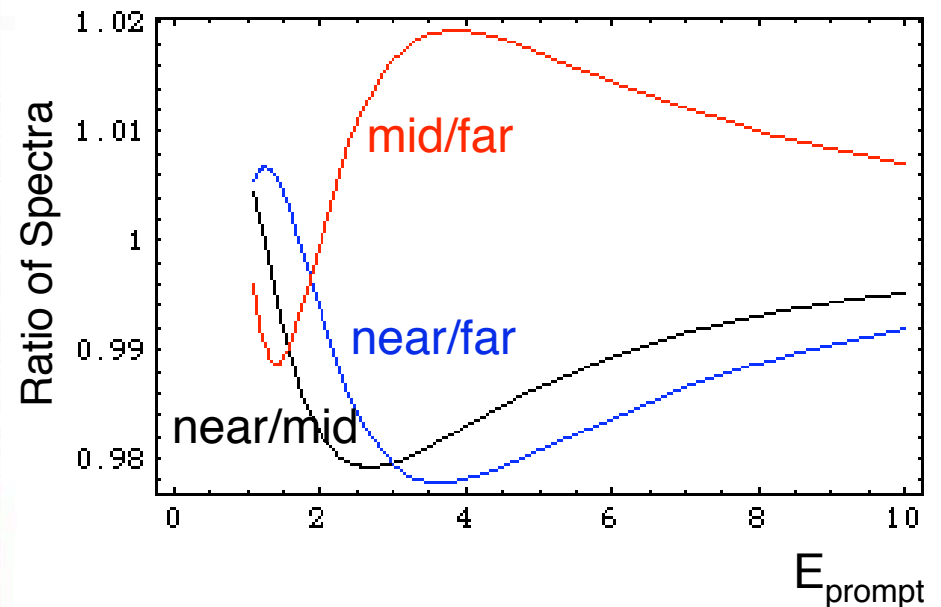

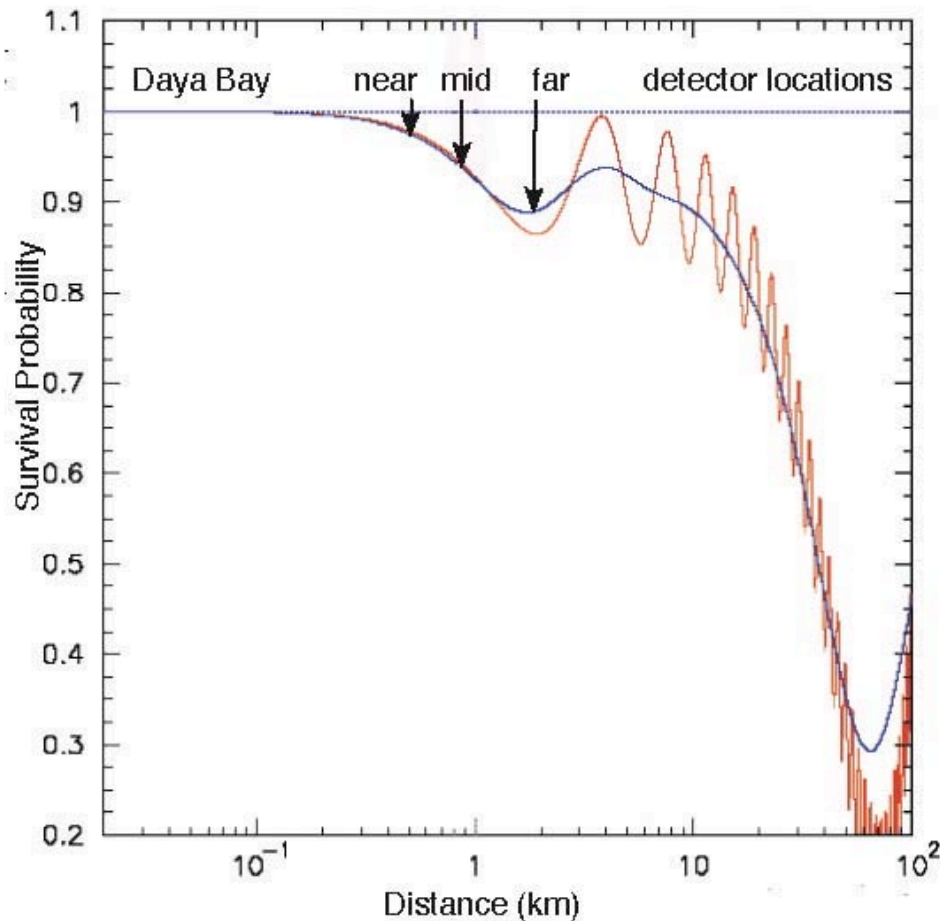

# Welcome to Daya Bay

## Distances & Overburden

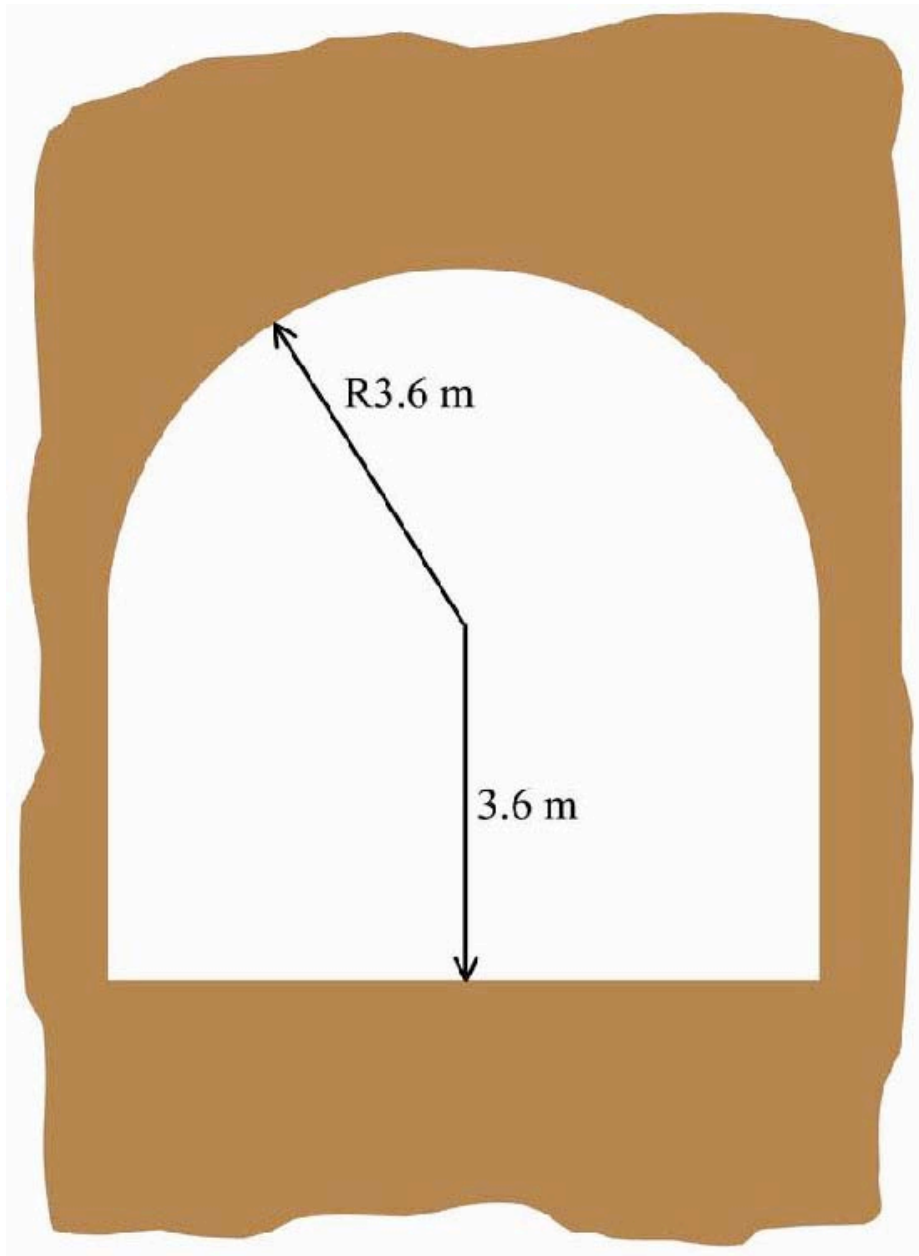

# Spectral Distortions with 3 Baselines

- 3 baselines provide consistency checks and eliminate single point failure of experiment, in particular if the backgrounds too high in near detector or unaccounted systematics in one of detectors

# Significant tunnels already exist at the Daya Bay site

On site service tunnel near DB reactor

1.5 km single lane tunnel at site

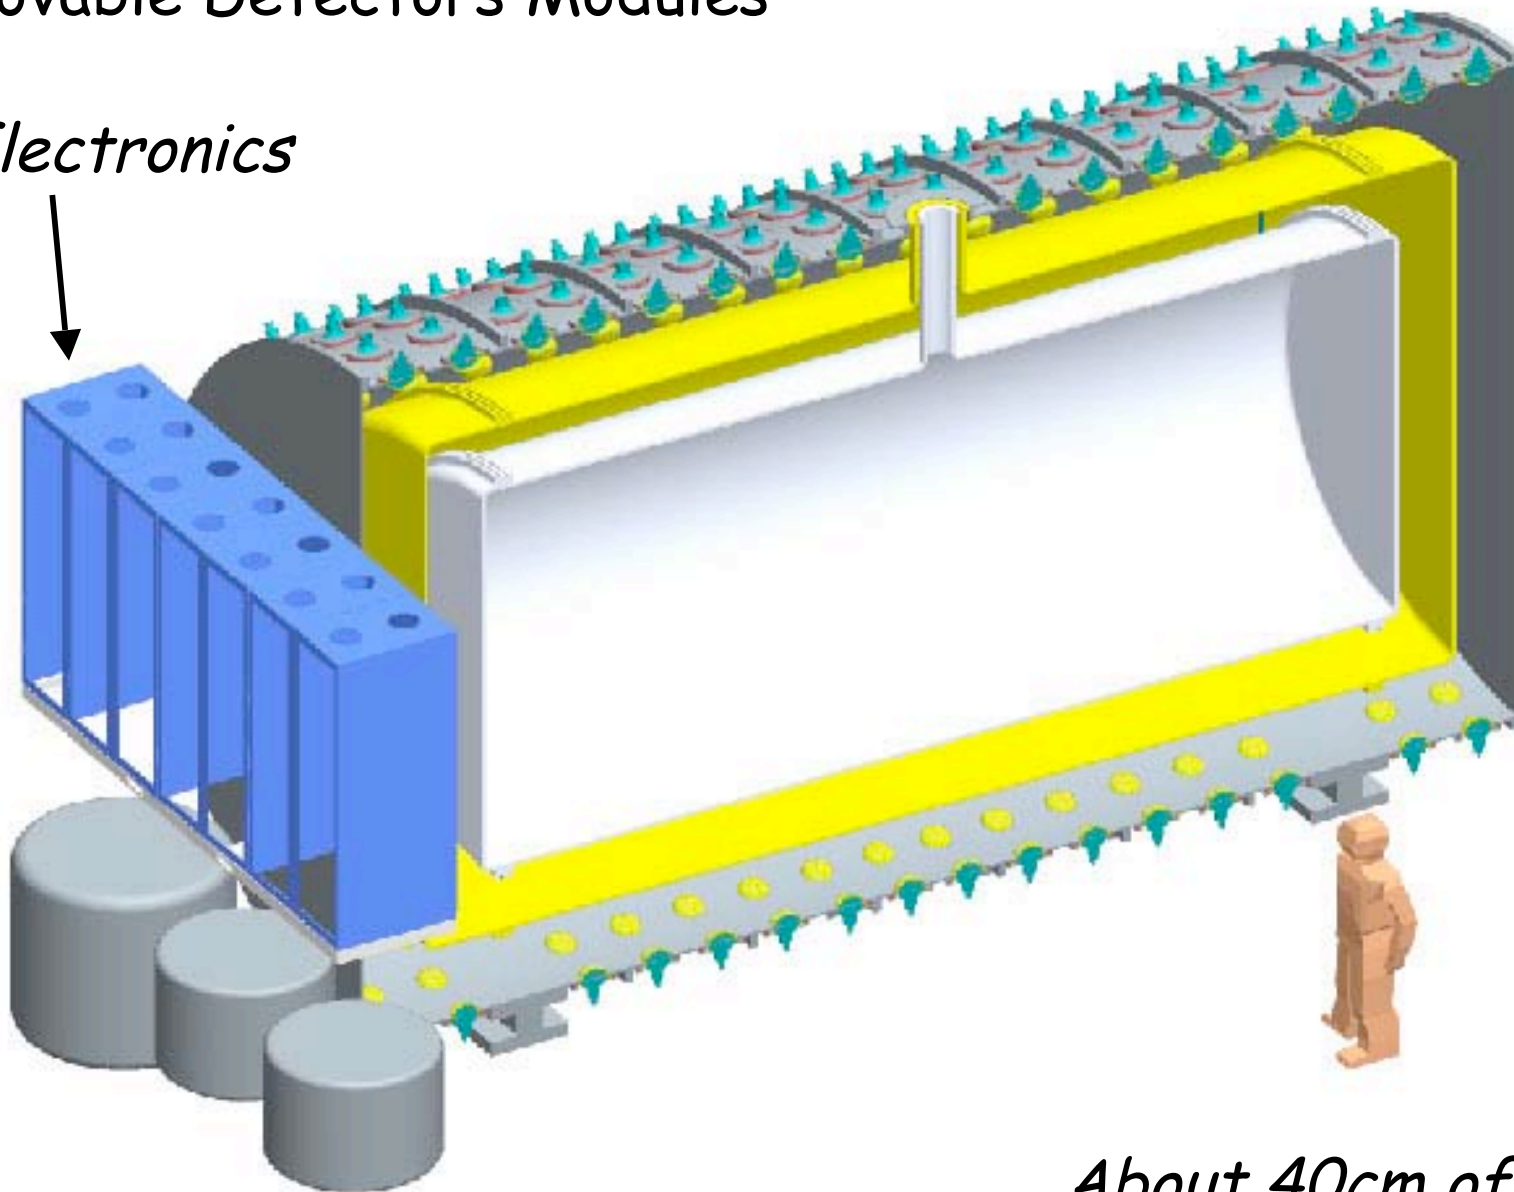

Daya Bay quarry will be filled with the tailings

1/2 of waste rock is used for overburden

## Movable Detectors Modules

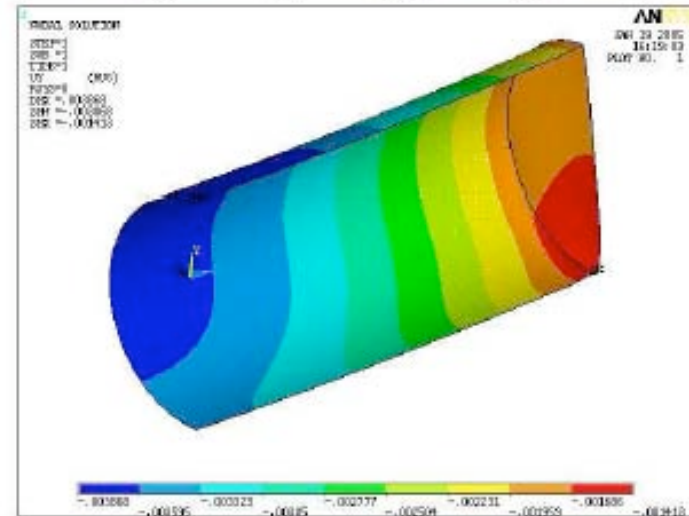

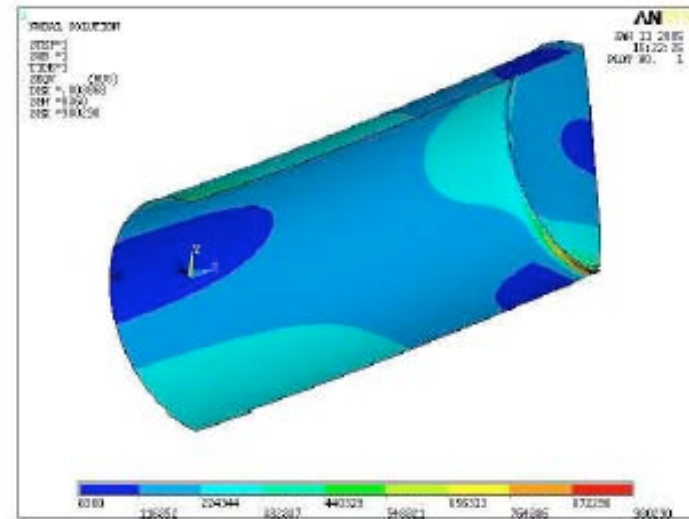

*Electronics*

40 ton FV PMTs on Barrel

*About 40cm of oil  
buffer to reduce bgds*

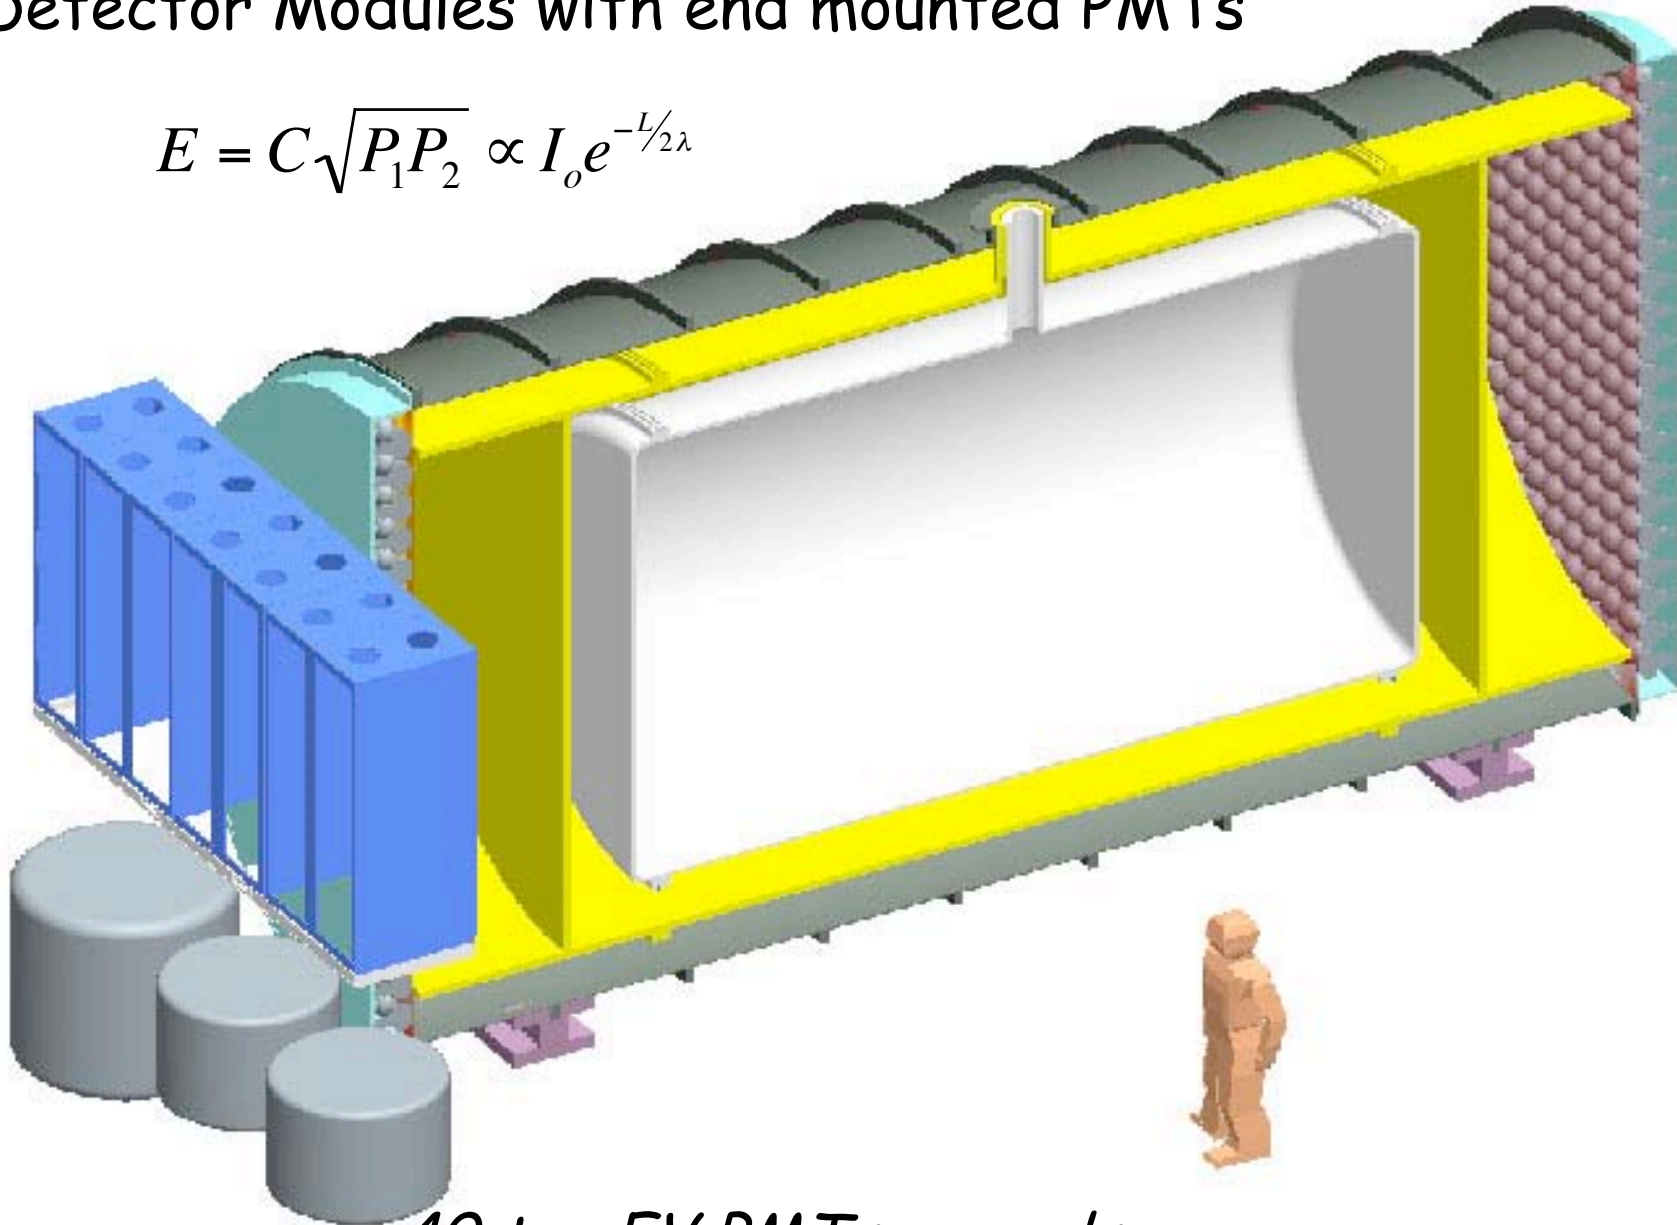

Manufactures have experience with large  
double walled acrylic structures

Stress Analysis of acrylic

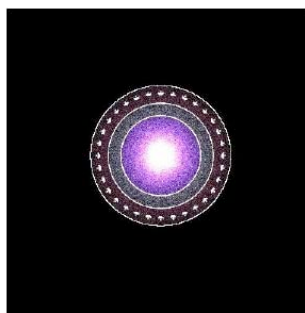

## Detector Modules with end mounted PMTs

$$E = C\sqrt{P_1 P_2} \propto I_o e^{-L/2\lambda}$$

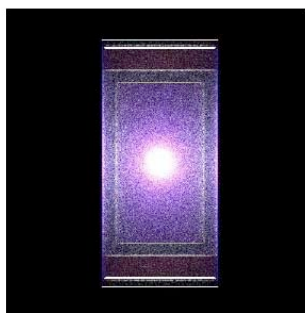

*40 ton FV PMTs on ends*

# Monte Carlo evaluation of detector designs

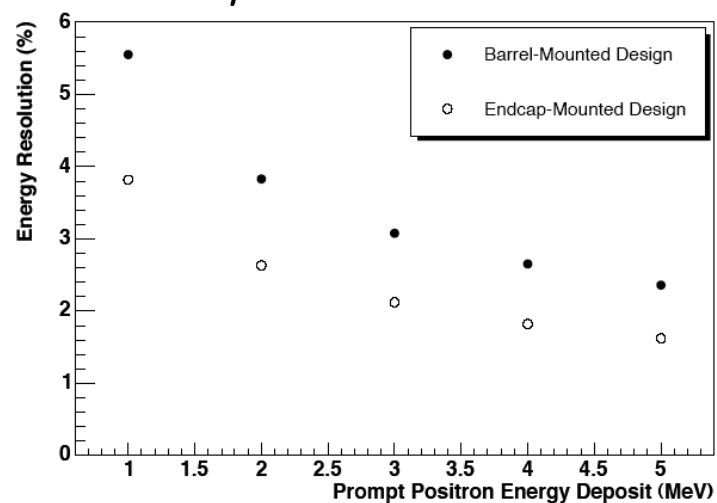

*Barrel-Mounted*

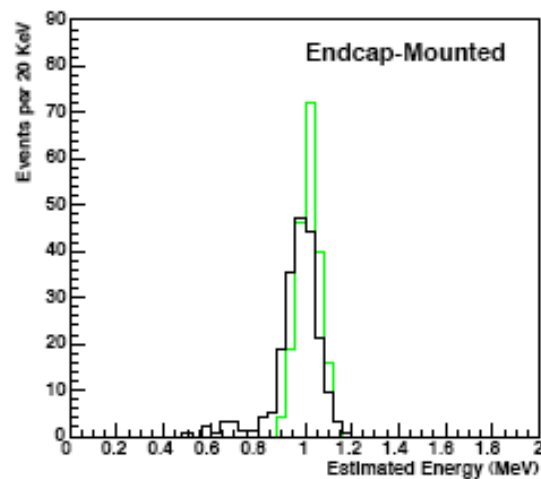

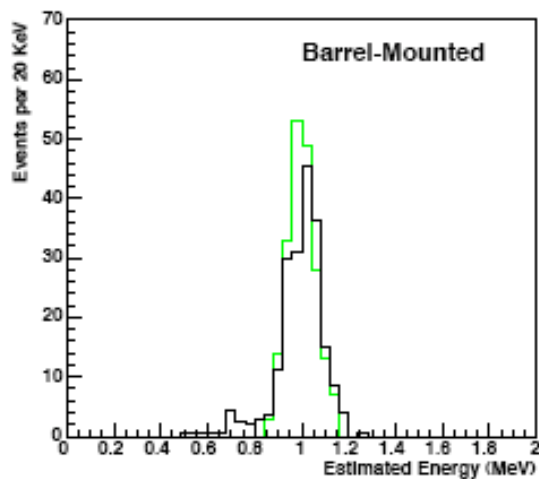

*Endcap-Mounted*

## *Response to Positrons*

## *Response to 2x0.511 MeV*

# Locomotion with commercially available airplane tugs

*Problem: transport ~150 ton detectors in 1-2 km long tunnels*

Ingersoll-Rand T-350

- 35,000 lb draw bar pull
- 6 cylinder diesel, 192 hp
- 16.5 feet long, 8 feet wide, 8.5 feet tall

Hough TD-500

- up to 747s
- 50,000 lb draw bar pull
- 8 cylinder diesel engine
- 65,000 lbs
- 26 feet long, 9 feet wide, 5 feet tall

Stewart and Stevenson GT-110

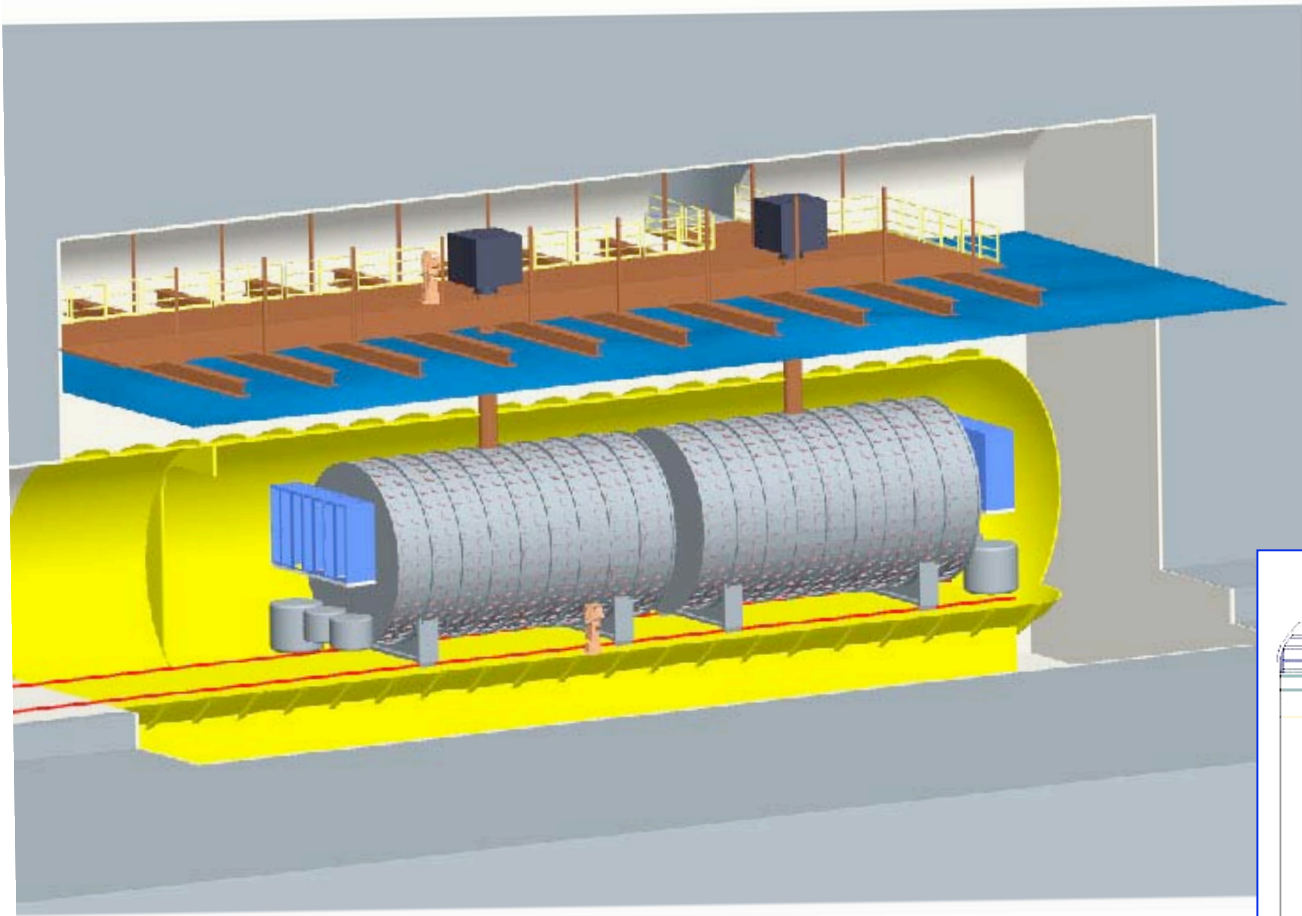

- 78,000 lb draw bar pull for gross vehicle weights up to 120,000 lb
- 6 cylinder diesel engine, 255 hp, 700 lb-ft max torque
- 4 forward gears, 3 reverse gears
- 5 mph @ 17,500 drawer bar pull (3<sup>rd</sup> gear); max is 13.5 mph

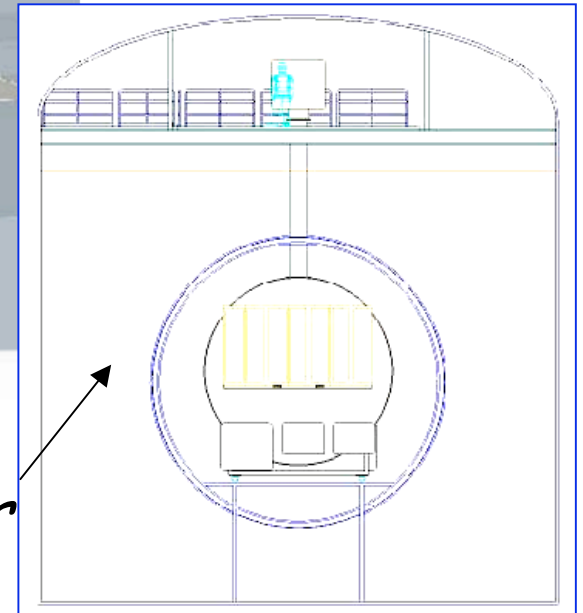

Electrically powered Tractors

*Solution: Hilman rollers with Accu-Roll guidance system and tugs.*

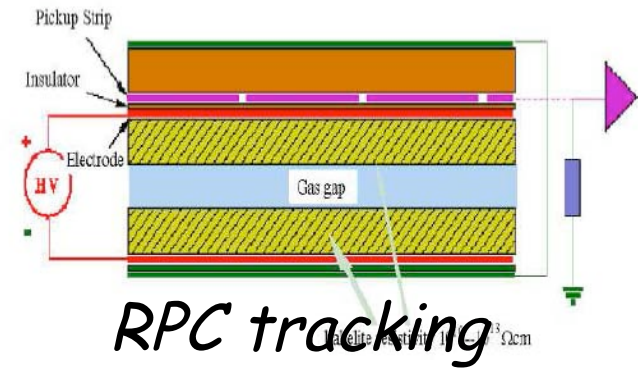

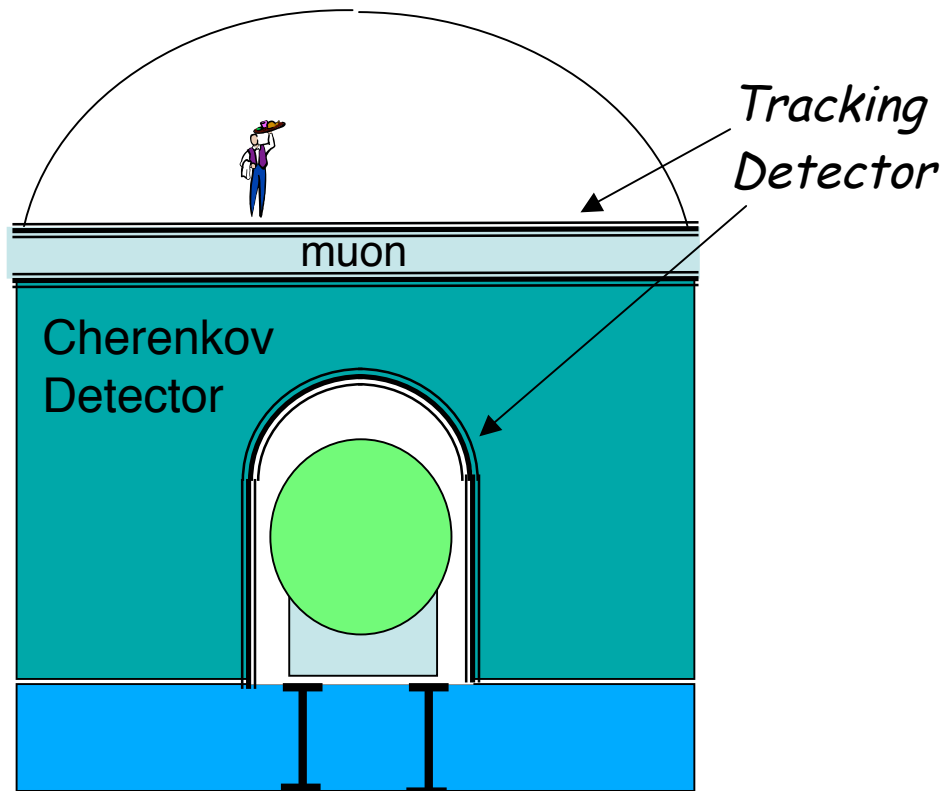

## Detector Halls (Water Rooms)

Water

# Muon Veto

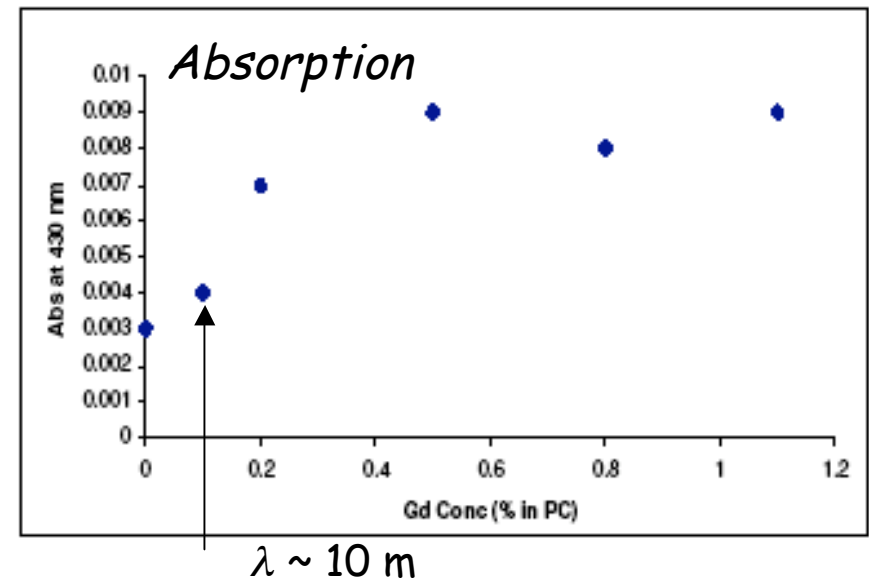

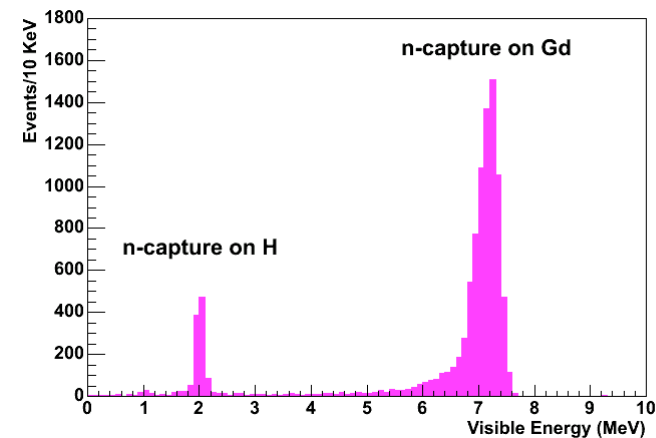

*MINOS extruded  
Scintillators*

## Liquid Scintillator

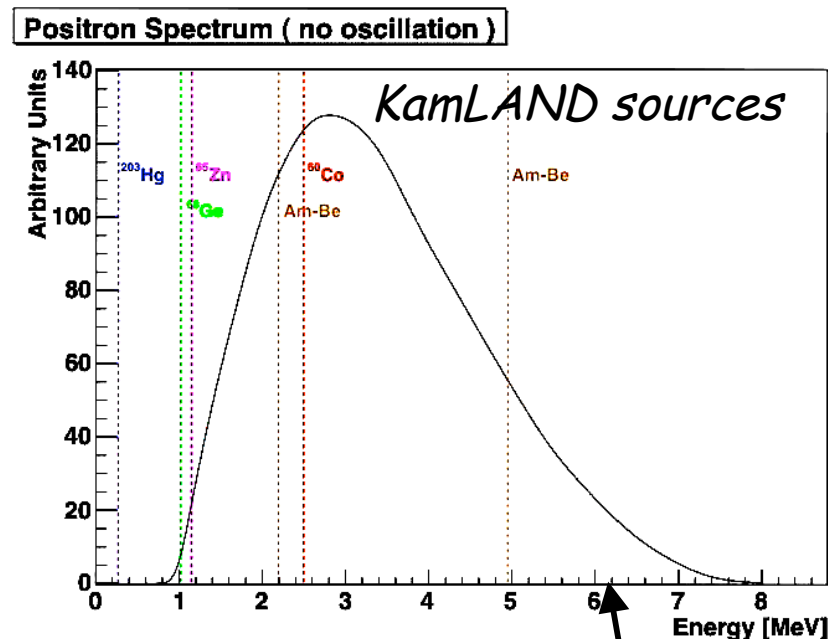

- Gd-loaded LS:  $\sigma_{\text{capture}} \sim 40,000$  barns,  $E_{\gamma} \sim 8$  MeV R&D to find stable 0.1% mixture underway at BNL and IHEP

- Chooz and Palo Verde used Gd dissolved in alcohol. Found to be unstable.
- The BNL group is working with carboxylic acid produced metal-organo chemical complexes dissolve in LS producing stable mixtures. Attenuation lengths of  $\sim 10$  m and no degradation over many months of aging tests made so far.

## Calibration

- A rigorous and well formulated calibration program is essential to a successful reactor experiment.

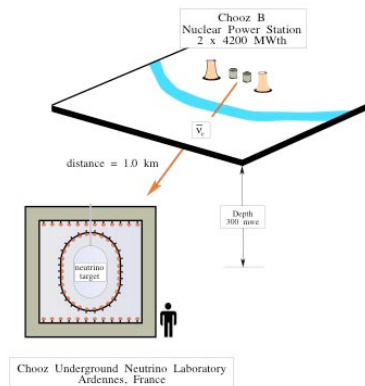

*A novel  $^{16}\text{N}$  source is under development*

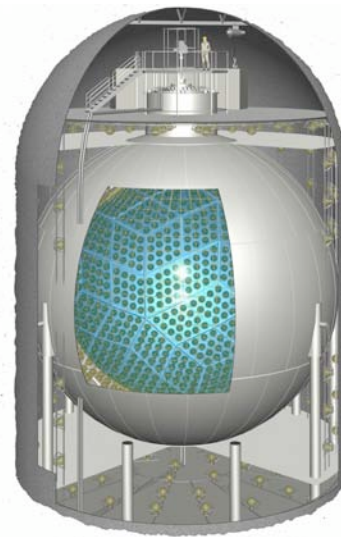

- *Gamma ray calibration sources with an empirically supported connection to positron energy deposition.*
- *Neutron sources*
- *lasers and LEDs*
- *electron and positron sources*
- *Spallation produced products:  $^{12}\text{B}$ , n-capture reactions.*

## Backgrounds

- Uncorrelated backgrounds from radioisotope contamination and residual muon produced spallation products.
- Correlated backgrounds from muon produced fast neutrons and beta delayed neutron decaying isotopes.

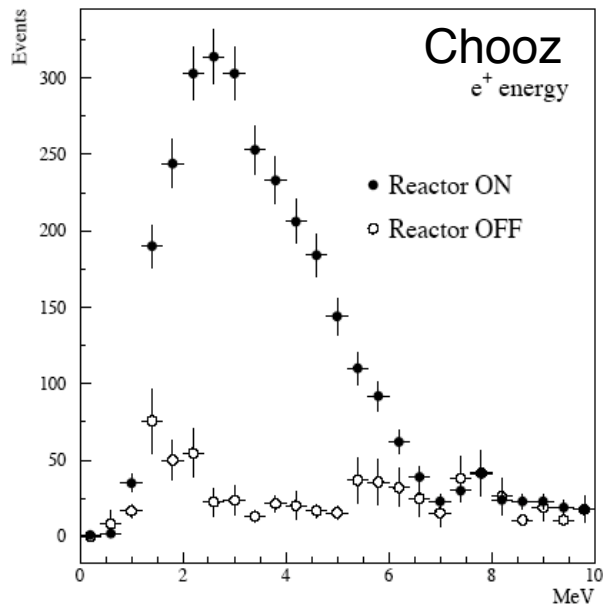

*CHOOZ*
